Research interests. The cost of useful quantum computation: proving how many expensive operations (T gates) and extra qubits a circuit needs, designing cheaper algorithms for error-corrected quantum computers, and finding where quantum algorithms beat classical ones.

Education

Imperial College London **Sep. 2026 – Sep. 2027 (expected)**
MSc, Physics with Quantum Dynamics *London, UK*

Carnegie Mellon University **Aug. 2023 – May 2026**
B.S. in Computer Science; ML and Algorithms & Complexity concentrations; University Honors *Pittsburgh, PA*

- Coursework: Quantum Computing, Complexity Theory, Learning Theory, Randomized Algorithms, Convex Optimization.

Research Experience

Institute for Quantum Computing (IQC), University of Waterloo **May 2026 – Aug. 2026**
Undergraduate Researcher (Mitacs Globalink Scholar), hosted by Michele Mosca and Vlad Gheorghiu *Waterloo, ON, Canada*

- Proved, in a **single-author** paper (arXiv:2610.01024), that no circuit without internal Hadamard gates can implement a layer of m non-overlapping Toffoli-type (CCZ) gates with fewer T gates than Campbell and Howard's $6m + 1$ construction, using a lower bound, computable in polynomial time, for a broad class of diagonal gates.
- On the output of PyZX's TODD-based optimizer, the bound proves 193 of 311 circuit pieces already optimal, against 113 for stabilizer nullity, the standard prior bound.

Magic State Labs **Aug. 2026 – Oct. 2026**
Research Consultant, with Pradeep Niroula *Remote*

- Proved the verification checks that decide whether a problem is a good fit for decoded quantum interferometry (DQI), a recent quantum optimization algorithm, and used them to score an AI-agent search that found two new candidate applications (arXiv:2610.06753).

Caltech Institute for Quantum Information and Matter (IQIM) **May 2025 – Aug. 2025**
SURF Undergraduate Researcher, Preskill group, with Samson Wang and James Watson (Google Quantum AI) *Pasadena, CA*

- Developed, as first author (arXiv:2608.13862; Google Research page), a simulation method for early error-corrected hardware that runs many shallow random circuits and combines their results classically. For a given accuracy its circuits are exponentially shallower than standard Trotter simulation, at the cost of a modest increase in the number of runs.
- Proved that the method converges, bounded its cost, tightened the bounds for systems with weak interactions or conserved quantities, and applied them to ground-state energies and the response properties that chemists and materials scientists most want from a simulation.

BlueQubit **Oct. 2025 – Present**
Part-time Researcher, AI and Core teams *Los Angeles, CA (remote)*

- Led a six-person study, as first author, benchmarking GPU-accelerated quantum simulators against commercial and open-source platforms (arXiv:2607.09882); the results fed into BlueQubit's simulator cost estimators.

Quantum Technologies Group, Carnegie Mellon University **May 2023 – Jun. 2025**
Researcher with Sridhar Tayur *Pittsburgh, PA*

- Wrote a tutorial on solving QUBO problems with QAOA and quantum annealing, with five open notebooks (*Tutorials in Operations Research*, INFORMS 2025).
- Implemented semidefinite-programming formulations for entanglement detection (CVXPY, PICOS, Gurobi).

Algorithms Group, George Mason University **May 2022 – Jun. 2025**
Researcher with Fei Li *Remote*

- Three papers on quantum and hybrid algorithms: string matching in Qiskit (AISS 2022); a hybrid D-Wave algorithm for the traveling salesman problem that beat pure classical and pure quantum baselines (IPDPS 2023); and shipment rerouting with up to 1,000 shipments on real transport networks (JSSR 2024).

Awards and Honors

- **Mitacs Globalink Research Award** and **IQC Undergraduate Research Award** (2026); **Caltech SURF Fellow** (2025); **IEEE QCE Student Travel Grant** (2026).
- **Duke STAQ NSF-funded Invited Scholar** (2025): selected for a PhD-level week on quantum simulation, error correction and hardware architecture.
- **YQuantum** (2025, Yale; 36 teams): 1st in the Alice & Bob track, then 2nd overall for the Yale Quantum Institute Grand Prize ($2,500); **MIT iQuHACK** (2026; 1,400+ participants): 2nd of 90+ teams, NVIDIA track.
- **Citadel/Correlation One Datathon** (2024): 2nd of 150 invited from 3,000+ applicants; **HackCMU** (2023): prize for an AI waste sorter piloted with CMU Dining.
- **Regeneron Science Talent Search Scholar** (2023), top 300 of 2,000+ nationally. **Olympiads:** USA(J)MO qualifier, USAPhO Bronze, USACO Gold, USNCO National Finalist.

Leadership and Outreach

CMU Quantum **Sep. 2024 – May 2026**
Founder and President (faculty advisor: Elias Towe) *Pittsburgh, PA*

- Founded CMU's first student quantum club and grew it to 200+ members with a 10-person leadership team; raised about $15,000 in sponsorship from General Motors and Boeing.
- Wrote the introductory teaching materials for workshops with IBM, IonQ and Quantinuum; co-designed a track for the UN Future Leaders in Quantum hackathon; ran CMU's node of the Qollab Global Hackathon (12 teams); took 15 students to UMD's Quantum Leap Career Nexus.

BlueQubit **Oct. 2025 – Present**
Head of Education and Student Outreach *Remote*

- Run hackathon tracks with Duke, Yale and Stanford, mostly for first- and second-year undergraduates (30–40 students in person and hundreds online per event). Built the Duke track from scratch: students test four hidden 30- to 36-qubit circuits, each designed to break a different simulation method, to find by experiment where classical simulation stops working.
- Helped write four tutorials and five blog posts on using GPU-accelerated simulators.

Talks and Posters

- **QRE 2026** and **UnitaryCon 2026** (one of 5 posters selected from 20), Toronto — posters, "Certified T-count floors for Toffoli networks and reversible circuits."
- **TQC 2026** — poster, "Resource-Efficient Quantum Eigenvalue Transform with Commutator Scaling" (PDF).
- **Caltech IQIM SURF Seminar**, Aug. 2025, and **Quantum Leap Career Nexus**, UMD, Nov. 2025 — talks, "Early Fault-Tolerant Quantum Algorithms for Matrix Functions via Trotter Extrapolation" (slides).
- **INFORMS Annual Meeting 2025** — talk on solving QUBO models on quantum computers.

Technical Skills

Languages and proof tools: Python, Julia, C++, Lean 4
Quantum and optimization: Qiskit, PennyLane, CUDA-Q, D-Wave Ocean; CVXPY, PICOS, Gurobi; CUDA, MPI
